A white, often bluish-white, fluid or liquor, secreted by the mammary glands of females of the class Mammalia, including the human species, and drawn from the breasts for the nourishment of their young. It is opaque, has little or no smell, a slightly sweet taste, and a neutral or slightly alkaline reaction. The milk of every animal has certain peculiarities which distinguish it from all other milk, but the general properties are the same in all. It consists chiefly of oleaginous and albuminous materials, with different salts. When milk is allowed to remain at rest it separates into two parts—a thick whitish fluid called *cream*, which collects in a thin stratum over its surface, and a more dense watery body remaining below. Butter is solidified cream, and is obtained artificially by churning. Milk which has stood for some time after the separation of the cream becomes acedent, and then coagulates. When the coagulum is pressed a serous fluid called whey is forced out, and there remains the caseous part of the milk, termed curd. Milk, however, is usually coagulated by the addition of rennet or the decoction of the stomach of a calf. The composition of milk is such that it is capable of supporting animal life without any other food. Milk may be brought to a dry state and powdered, in which state it will keep for a length of time; and by dissolving it in tepid water a kind of semi-artificial milk may be formed.—2. In the stricter language of mineralogy, a *mineral* species is a substance whose form, chemical composition, and physical properties are sufficiently uniform and persistent to admit of identification, as diamond, rock-crystal, garnet, and so forth. In this sense also geologists speak of *simple minerals*, meaning thereby the primary ingredients of rock-masses. Thus ordinary granite, as a compound rock, consists of the simple minerals, quartz, felspar, and mica, though, chemically speaking, each of these is composed of several elementary ingredients. Page.

It comprehends the study or science of all inorganic substances in the earth or on its surface. As distinguished from geology, mineralogy deals with the various mineral bodies as separate constituents of the earth's crust, and examines their properties as such, while geology treats them in the aggregate, as building up the crust of the earth, and as forming masses and presenting phenomena that have a history to be investigated. Minerals may be described and classified either in accordance with their chemical composition, their crystallographic forms, or their physical properties of hardness, fracture, colour, lustre, &c., or a combination of all, and thus various systems of classification have been adopted.

They also appear to have accompanied their songs with mimicry and action, and to have practised such various means of diverting as were admired in those rude times, and supplied the want of more refined entertainment. These arts rendered them extremely popular and acceptable in England and the neighbouring countries. The person of the minstrel was sacred; his profession was a passport; he was 'high placed in hall, a welcome guest;' no high scene of festivity was considered complete that was not set off with the exercise of the minstrel's talents. So long as the spirit of chivalry existed the minstrels were protected and caressed, because their songs tended to do honour to the ruling passion of the times, and to encourage a martial spirit. The *miocene* strata contain an admixture of the extinct genera of lacustrine mammalia of the *eoene* series, with the earliest forms of genera which exist at the present time. In deserts where the surface is perfectly level, a plain thus assumes the appearance of a lake, reflecting the shadows of objects within and around it. The mirage is commonly vertical, that is,

presenting an appearance of one object over another, like a ship above its shadow in the water. Sometimes, however, the images are horizontal.

A looking-glass; any glass or polished substance that forms images by the reflection of rays of light; a speculum. Mirrors are either plane, convex, or concave. Plane mirrors, or those having a plane surface, represent bodies of their natural magnitude. Convex mirrors disperse the rays, and in consequence diminish the images of objects. I love such mirth as does not make figures
 ashamed to look upon one another next morning. *Is. Walton.*

—*Mirth, Cheerfulness.*

I have always preferred *cheerfulness* to *mirth*. The latter I consider as an act, the former as a habit, of the mind. *Mirth* is short and transient; *cheerfulness*, fixed and permanent. Those are often raised into the greatest transports of *mirth*, who are subject to the greatest depressions of melancholy; on the contrary, *cheerfulness* (though it does not give the mind such an exquisite gladness), prevents us from falling into any depths of sorrow. *Mirth* is like a flash of lightning, that breaks through a gloom of clouds, and glitters, for a moment; *cheerfulness* keeps up a kind of daylight in the mind, and fills it with a steady, and perpetual serenity. *Addison.*

Mollusca (mól-us'ka), *n. pl.* An animal sub-kingdom, comprising those soft-bodied animals which are usually provided with an exo-skeleton or shell. They have a distinct alimentary canal, shut off from the general cavity of the body, and situated between the blood-system, which lies along the back, and the nerve-system, which is towards the ventral aspect of the body. The digestive system consists of a mouth, gullet, stomach, intestine, and anus, except in a few forms, in which the intestine ends blindly. The blood is almost colourless. Respiration is variously effected: in the sea-mats it takes place mainly by the agency of a crown of ciliated tentacles surrounding the mouth; in the sea-squirts, by a greatly-developed pharynx perforated by numerous ciliated apertures; in the lamp-shells, by long ciliated arms springing from the sides of the mouth; in the bivalve shell-fish, the cuttle-fishes, and most of the univalves, by gills; while in the remainder of the univalves, as snails, slugs, &c., the breathing organs have the form of an air-chamber or pulmonary sac, adapted for breathing air directly. The chief peculiarity, however, of the Mollusca is in the nervous system, which in the lower forms consists essentially of a single ganglionic mass, giving off filaments in various directions; while in the higher there are three such masses, united to one another by nervous cords. According as they possess one or three ganglia the Mollusca are divided into two great divisions—*Molluscoidea*, those having a single ganglion or principal pair

Mollusca and Molluscoidea.

of ganglia, and the *Mollusca proper*, possessing three principal pairs of ganglia. The Molluscoidea are subdivided into three classes—*Polyzoa*, comprising the sea-mosses and sea-mats; *Tunicata*, the sea-squirts; and *Brachiopoda*, of which *Lingula* and *Terebratula* (the lamp-shells) are examples. The Mollusca proper are subdivided into four classes—*Lamelibranchiata*, in which there is no distinct head, comprising mussels, scallops, oysters, &c.; *Gasteropoda*, com-

The word is usually applied to the houses for monks. Among Christians monasteries for men were first founded in Upper Egypt about the year 305 by St. Antony. About the middle of the same century female monasteries or convents of nuns were instituted. Monastic vows were not, however, introduced till the sixth century, by St. Benedict. The number of monasteries was much diminished at the Reformation, when their rich estates were in part appropriated by the sovereign of the state to his own use, and partly transferred to universities and other educational institutions, &c. It is to the monasteries we owe the preservation of nearly all ancient classical and early mediæval literature. The monastic life is practised among the Brahmans and Buddhists, and has been so from pre-Christian times.

Monera (mo-nē'ra), *n. pl.* [Gr. *monērēs*, solitary.] A name proposed by Haeckel for certain minute marine organisms, which may be provisionally regarded as the lowest group of the Rhizopoda. The body is composed of structureless sarcode, exhibiting nothing in the way of definite organs, and has, at most, a number of small particles or molecules scattered through it. These organisms exhibit active changes of form, by the formation of *pseudopodia*—sometimes in the form of broad short lobes, and sometimes as elongated filaments—which are retracted or effaced by the development of others from the adjacent parts of the body. These processes serve as organs of locomotion and prehension, and by means of them the animals take solid matter, which serves as food, into all parts of their body, the undigested exuvie being rejected from all parts in the same indiscriminate way. Reproduction is by fission. The Monera differ from the Foraminifera chiefly, if not entirely, in the absence of a shell. They are supposed to be at the very base of the animal kingdom, or rather according to Haeckel to form a kingdom, *Regnum Protisticum*, between animals and vegetables.

The name given to a certain modification or disturbance of the regular course of the trade-winds which takes place in the Arabian and Indian seas. Between the parallels of 10° and 30° south latitude the eastern trade-wind blows regularly, but from the former parallel northwards the course is reversed for half the year, and from April to October the wind blows constantly from the south-west. During the other six months of the year the regular north-east trade-wind prevails. In some places the change of the monsoons is attended with calms; in others, with variable winds, and in others, as in China, with tempests. These tempests seamen call the *breaking up of the monsoons*.—2. An alternating wind in any region. See *Extract*.

The word *monsoon* is now used for alternating winds in other regions; and as this custom is becoming popular, it would, perhaps, be well to use the term, in books on Physical Geography, for any winds at any locality whose direction shifts with the seasons, and which divide the year, however unequally, between them. Using the term, then, in this wider sense, we have *monsoons* in the China seas, in the Mexican Gulf, on the coasts of Africa, and South America. *Prof. Young*.

In ecclesiastical matters a calendar month is always understood. G. *mond*, moon, is a derivative like E. *month*), Lith. *menų*, Gr. *mēnē*, Per. *ma*, Skr. *mā*, all meaning the moon; from a root *mā*, to measure: the moon was early adopted as a measurer of time, hence the name.] 1. The heavenly orb which revolves round the earth; a secondary planet or satellite of the earth, whose borrowed light is reflected to the earth, and serves to dispel the darkness of night. The moon, after the sun, is not only the most conspicuous, but in an astronomical point of view the most interesting of the heavenly bodies. The variety of her phases, her eclipses, and the rapidity with which she changes her place among the fixed stars, drew the attention of the earliest observers of the heavens; while in modern times the important application of the theory of her motions to navigation, and the determination of terrestrial longitudes, has given the *lunar theory* the first rank among the objects of astronomical science. Among all the heavenly bodies the moon is the nearest to us. The mean distance of its centre from that of the earth is 59·96 of the earth's equatorial radii, or about 237,000 miles; its diameter is 2160 miles, and its magnitude about $\frac{1}{4}$ th of that of the earth; it completes its revolution round the earth, or makes the tour of the heavens, in a mean or average period of 27 days, 7 hours, 43 minutes, 11·5 seconds, which constitutes the *sidereal month*. (See **MONTH**.) The motion of the moon round the earth is subject to great inequalities, arising from the sun's attraction, combined with the different positions of the moon in regard to the earth and sun; it revolves on its own axis in the same time that it takes to revolve round the earth, as appears from its always presenting the same side to the earth. The face of the moon appears to the naked eye diversified by dark and bright patches, which on being examined with a good telescope are discovered to be mountains and valleys, the mountains appearing to be of a volcanic character. The moon has no clouds nor any other indication of an atmosphere.—2. A satellite of any planet; as, the *moons* of Jupiter.—3. The period of a revolution of the moon round the earth; a month. It consists of a cylinder caused to revolve about a vertical axis by the descent of a weight attached to a rope wound round a horizontal axis the rotation of the cylinder being continually accelerated in accordance with the acceleration of the descending weight. By means of a pencil gently pressed by a spring, on a sheet of paper, the horizontal velocity of the cylinder at each unit of time, while the weight is descending, is registered. This shows it to increase as the square of the time, or as the numbers 1, 4, 9, 16, &c., thus confirming the theory of falling bodies.

Mormon (môr'mon), *n.* A member of a sect founded in 1830 by Joseph Smith, a native of the United States. The distinguishing peculiarities of the sect are—the belief in a continual divine revelation through the inspired medium of the prophet at the head of their church, the practice of polygamy, and a complete hierarchical organization. The supreme power, spiritual and temporal, rests with the president or prophet (elected by the whole body of the church), who alone works miracles and receives revelations. The Mormons accept both the Bible and the Book of Mormon as divine revelations, but hold them equally subject to the explanation and correction of the prophet. The latter mentioned book (really a kind of historical romance written by one Solomon Spaulding in 1812) pretends to be a history of America from the first settlement of the continent after the destruction of the tower of Babel up to the end of the fourth century of our era, at which time flourished the legendary prophet Mormon, its reputed author. It was said to have been written on gold plates, and concealed until its hiding-place was revealed to Smith by an angel. The Mormons first appeared at Manchester, New York, whence they were compelled by the persevering hostility of their neighbours to flee, first to Kirtland in Ohio (1831), then to Nauvoo, the 'City of Beauty,' in Illinois (1838), and finally to the Salt Lake in Utah (1848). In 1844 the founder, Joseph Smith, was shot by a mob in Carthage prison, where his lawless behaviour had brought him. The sect has continued to increase, and can claim adherents in most parts of the world. They call themselves the Church of Jesus Christ of Latter-day Saints. The advance made by Mormonism seems to have been due far more to the abilities of Brigham Young, the successor of Smith, than to the founder himself, who was little better than a dissipated and immoral scamp.

They are found in the Nile and Senegal, and their flesh is said to be excellent.

Mormyrus (môr'mi-rus), *n.* [See above.] A genus of malacopterygious fishes, nearly allied to the pike family. The *M. oxyrinchus*, or sharp-nosed mormyrus, is an inhabitant of the Nile, and is regarded as one of the best fishes in that river.

Mortgage (*mor'gaj*), *n.* [*Fr. mort*, dead, and *gage*, pledge.] The grant of an estate or other immovable property in fee as security for the payment of money, and on the condition that if the money shall be paid according to the contract the grant shall be void, and the mortgagee shall reconvey the estate to the mortgager. [The transfer of the possession of movable chattels to secure repayment of a debt is called a *pledge*, not a *mortgage*. See **PLEDGE**.] The term is applied differently: (a) to the transaction; (b) to the deed by which it is effected; and (c) to the rights conferred thereby on the mortgagee. If the mortgage is not duly redeemed in the time and manner specified in the instrument by the mortgager the mortgagee acquires by common law the absolute title to the property. But in this case courts of equity may interpose and give the mortgager a right of re-entry on his property on condition of subsequent payment of his obligation with interest. This is called the *equity of redemption*, and may be exercised within twenty years of the mortgagee's entry on the estate or of his last-written acknowledgment of the mortgager's interest in it. On the other hand, the mortgagee may, on the violation of the condition of the mortgage, by filing a bill of foreclosure, compel the mortgager either to redeem his pledge or forfeit his equity of redemption. In Scotland mortgages are generally called bonds and dispositions in security.

(*See MULLIDÆ, SURMULLET.*) Of the true mullets the genus *Mugil* is the type, and by some is held to be coextensive with the family. The characteristics are a nearly cylindrical body covered with large scales; six branchiostegal rays; head somewhat depressed; the scales large; the muzzle short; an angular rise in the middle of the lower jaw, which fits into a corresponding hollow in the upper, and very minute teeth. The best known species is the common gray mullet or great mullet (*M. capito*) found round the shores of the British islands, and in particular abundance in the Mediterranean. Mummy (mum'i), *n.* [*Fr. mumie*, *nomie*, *Sp. momia*, *It. mummia*, from *Ar. mūmtā*, from *mālm*, wax; Coptic *mum*, bitumen, gum-resin.] 1. A dead human body embalmed and dried after the manner of those taken from Egyptian tombs. An immense number of mummies have been found in Egypt, consisting not only of human bodies, but of various animals, as bulls, apes, ibises, crocodiles, fish, &c. The processes of embalming bodies were very various. Those of the poorer classes were merely dried by salt or natron, and wrapped up in coarse cloths. The bodies of the rich and the great underwent the most complicated operations, and were laboriously adorned with all kinds of ornaments. The embalmers extracted the brain through the nostrils, and the entrails through an incision in the side. The body was then shaved and washed, the belly filled with perfumes, the whole body covered with natron, and steeped in the same material for seventy days. After this the body was washed, steeped in balsam, and then wrapped up in linen bandages, sometimes to the number of twenty thicknesses; various ornaments were placed above the bandages, particularly about the head. The body was then put into an ornamented case of sycamore wood. Sometimes the cases were double. The Egyptian mode of embalming was imitated occasionally by the Jews, Greeks, Romans, and other nations. The term mummy is likewise given to human bodies preserved in other ways, either by artificial preparation or by accident. The Guanches, or ancient people of the Canaries, embalmed their dead in a simple but effectual manner; and one cavern in Teneriffe when discovered had upwards of a thousand mummies in it, several of which had distinct, though contracted features. In some situations, the conditions of the soil and atmosphere, by the rapidity with which they permit the drying of the animal tissues to be effected, are alone sufficient for the preservation of the body in the form of a mummy. This is the case in some parts of Peru, especially at Arica, where considerable numbers of bodies have been found quite dry, in pits dug in a saline dry soil. And in some countries natural mummies are occasionally found in caverns. During the fifteenth and sixteenth centuries mummies were used for nostrums against disease, and other medical purposes, and a peculiar brown colour, used as the background of pictures, was obtained from the bitumen.—2.† Liquor which distills from mummies; a liquor prepared from dead bodies and considered to have very potent qualities; a medicinal liquor or gum in general.

When the fibres of a muscle are placed parallel to each other it is called a *simple* or *rectilinear* muscle; when they intersect and cross each other they are called *compound*. When muscles act in opposition to each other they are termed *antagonists*; when they concur in the same action they are called *congeners*. Whether in the Vedas, in the Platonists, or in the Hegelians, *mysticism* is neither more nor less than ascribing objective existence to the subjective creations of our own faculties, to ideas or feelings of the mind, and believing that, by watching and contemplating these ideas of its own making, it can read in them what takes place in the world without.

N.

N is the fourteenth letter and the eleventh consonant of the English alphabet. Its ordinary sound, as in *not*, *run*, is formed by placing the tip of the tongue against the palate at or close behind the root of the upper teeth, and sending a voiced sound through the nose. It differs from *m* in the fact that the tongue and roots of the teeth are brought together instead of the lips, that is, it is a dental nasal instead of being (like *m*) a labial nasal. Before gutturals it slides into a guttural nasal sound, as in *sink*, *finger*, a sound also represented by the digraph *ng*, as in *sing*. When the gutturals belong to a different syllable the *n* may retain its other

sound, as in *enquif*, *congratulate*, *jonquil*, &c. When final after *m* it is silent, as in *hymn* and *condemn*. As an initial sound it occurs alone or after the consonants *g*, *k*, *m*, *p*, these consonants in this position being silent. The initial combinations *gn*, *kn*, as in *gnaw*, *know*, belong to words of Teutonic origin, and the *g* or *k* (c) were formerly pronounced distinctly along with the *n*, as they still are in some of the dialects, Scotch for instance. The initial combinations *mn* and *pn*, as in *mnemonic*, *pneumatic*, occur only in words from the Greek. The only consonant which is always sounded before *n* initial is *s*, as in *snare*, *snow*, &c. No consonant

can come after it at the beginning of a syllable. At the end it may be followed by the dentals *d* and *t*, the guttural *k* (with *g* it forms a single sound), and the sibilant sounds *s*, *z*, *sh* (or their equivalents), all of which are sounded distinctly. At a very early stage of the language it was rejected from words in which it came before *f*, *s*, and *th*, and thus it has disappeared from *soft*, *goose*, *tooth*, *other*. It has also been lost in various other cases. Thus *auger*, *adder*, *apron*, should properly have an *n* at the beginning, while *ell*, *mill*, once had *n* at the end. *Neut*, on the other hand, has borrowed its *n* from an indefinite article. In *nightingale*, *messen-*

oil, pound; ü, Sc. abune; ý, Sc. fey.

ger, passenger, it is likewise an intrusive element. In many cases, both in English and other languages, *n* final has been felt as too weak a sound by itself, and a strengthening element has been added, hence the *d* in *thunder, sound*, and the *t* in *tyrant*. In *comfort m* was originally *n*; in *quint*, *n* was *m* originally.—As a numeral *N* signified 900, and with a stroke over it, *N̄*, 9000.—As an abbreviation, *N* stands for north; *N.B.* for nota bene, note well, and North Britain or Scotland; *N.P.* for notary public, &c.

ment, subdivided by a diagonal line into two triangles. A sufficient number of rods must be provided for each of the headings, 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, so that by placing the proper rods side by side any number may be seen at the top, while the several multiples occupy, in order, the eight lower compartments; when the multiple consists of two figures these are placed one on each side of the diagonal line. There is also a rod called the *index-rod*, the squares on which are not subdivided into triangles. To multiply, for example, the number 6789 by 56. Place four of the rods together, so that the top numbers form the multiplicand; then look on the index-rod for 6, the first number of the multiplier, and on the corresponding compartments of the four rods the following

The act of navigating; the act of passing on water in ships or other vessels; sailing; as, the *navigation* of the northern seas.—2. The science or art of conducting ships or vessels from one place to another. The management of the sails, rudder, &c., or the working of the ship generally, though essential to the practice of navigation, belongs rather to seamanship, navigation being more especially the art of directing and measuring the course of ships, the method of determining the position, &c., by the laws of geometry, or by astronomical principles and observations. Navigation turns chiefly upon four things, two of which being given or known, the rest are thence found out. These are the difference of latitude, difference of longitude, the reckoning or distance run, and the course or rhumb sailed on. The places of the sun, moon, planets, and fixed stars are deduced from observation and calculation, and arranged in tables, the use of which is absolutely necessary in reducing observations taken at sea for the purpose of ascertaining the latitude and longitude of the ship, and the variation of the compass. The course and distance are ascertained by means of the log-line, or dead-reckoning, together with the compass. By mathematics the necessary tables are constructed, and rules investigated for performing the more difficult parts of navigation. (See **LATITUDE**, **LONGITUDE**, **SAILING**, &c.)—3. Between 1841 and 1859 steam were gradually substituted for sailing vessels in the British navy, and since 1860 armour-plated ships, armed with guns of enormous calibre, either in broadside or in turrets, have been introduced, as also torpedo craft, &c. The ironclad fleet, the most important division of the navy, is divided into classes according to strength of armour and armament and mode of construction. The government of the navy is vested in the Board of Admiralty, the members of which are styled 'lords commissioners for executing the office of lord high admiral'. The board consists of six members: the *first lord*, who has supreme authority, and is always a member of the cabinet; four other naval lords, known respectively as the *senior naval lord*, the *second naval lord*, the *third naval lord* and controller, and the *junior naval lord*; and lastly a *civil lord*; each of these having special duties falling to his charge, as the direction of the movements of the fleets, the management of the dockyards, the building, equipment, and repair of ships, and the victualling of the fleets. Under the board is a financial secretary, changing, like the lords, with the government in power; while the fixed administration consists of a permanent secretary, heads of departments, &c. The highest rank in the active service is that of admiral, of which there are three grades, viz. admirals, vice-admirals, and rear-admirals. The command of each ship is intrusted to a captain or to a commander, or other officer, according to the size of the ship. These zones being condensed, and partaking of the primary rotation, constituted the planets, some of which in turn threw off zones which now form their satellites. The main body being condensed towards the centre formed the sun.

They are composed of bundles of white, parallel, medullary threads, often so interwoven

as to form a kind of net-work; and some of them have rounded masses of nervous matter, not fibrous, termed ganglia. There are two systems of nerves: (a) those of *animal life*, or the *cerebro-spinal nerves*, which are concerned with volition and muscular movements, with the control of the senses, and in higher forms with the operations of the mind. They proceed from the brain and spinal marrow, and contain, generally inclosed in the same sheath, the centripetal filaments, which convey impressions from their extremities to the brain; and the centrifugal filaments, which convey the influence of the will from the brain to the voluntary muscles. (b) Those of *organic life*, the *ganglionic* or great *sympathetic nerves*, which proceed from a chain of ganglia extending from the brain to the pelvis, are chiefly distributed to the viscera, such as the heart, stomach, intestines, blood-vessels, &c., and whose operation is for the most part involuntary, and without the influence or command of the will. The people who lived at a distance from the great theatre of political contention could be kept regularly informed of what was passing there only by news-letters. To prepare such letters became a calling in London, as it now is among the natives of India. The news-writer rambled from coffee-room to coffee-room, collecting reports, squeezed himself into the sessions house of the Old Bailey if there was an interesting trial, nay, perhaps obtained admission to the Gallery of Whitehall, and noticed how the king and duke looked. In this way he gathered materials for weekly epistles destined to enlighten some county town or some bench of rustic magistrates. Such were the sources from which the inhabitants of the largest provincial cities and the great

body of the gentry and clergy learned almost all they knew of the history of their own time.

Every publication giving original reports of parliamentary debates keeps one of a series of reporters constantly in the gallery of the Lords, and another in that of the Commons. These are at stated periods relieved by their colleagues, when they take advantage of the interval to transcribe their notes, in order to be ready again to resume the duty of note-taking, and afterwards that of transcription for the press. A succession of reporters for each establishment, varying from ten or eleven to seventeen or eighteen, is thus maintained, and the process of writing from their notes never interrupted, till a complete account of the debates of the evening has been committed to the hands of the printer.

They cast their skins very frequently, and when they lose one of their members—a leg, the tail, or even an eye—a new one is not long in being produced in its place. Called also *Eft*, *Asker*.

D'Israeli*.

Among the most shocking of the unscholarlike barbarisms now prevalent, I must notice the use of the word 'nice' in an objective instead of a subjective sense: 'nice' does not and cannot express a quality of the object, but merely a quality of the subject: yet we hear daily of 'a very nice letter'—'a nice young lady,' etc.—meaning a letter to a young lady that it is pleasant to contemplate; but a nice young lady means a fastidious young lady; and 'a nice letter' ought to mean a letter that is very delicate in its eating and in the choice of its company. *De Quincey*.

'I should say she was not an agreeable person. Not nice,' added Lady Selina, after a pause, and conveying a world of meaning in that conventional monosyllable. *Lord Lytton*.

in the plan, and sometimes also square-headed. They were ornamented with pillars, architraves, consoles, and in other ways. In the architecture of the middle ages niches were extensively used as decorations and for the reception of statues. In the Norman style they were so shallow as to be little more than panels, and the figures were frequently carved on the back in alto-relievo. In the Early English style they become more deeply recessed and are highly enriched, and in the Decorated style they become infinitely varied. Their plans chiefly consisted of a semi-octagon or a semi-hexagon, and their heads were formed into groined vaults, with ribs, and bosses, and pendants. They were projected on corbels, and adorned with pillars, buttresses, and mouldings of various kinds, and had canopies added to them which were flat and projecting in every variety of plan, and elaborately carved and enriched. In the Perpendicular style this variety and elaboration continued.

She was punished by having all her children put to death by those two deities. She her-

self was metamorphosed by Zeus (Jupiter) into a stone which shed tears during the summer. This fable has afforded a subject for art, and has given rise to the beautiful group in the tribune at Florence, known by the name of Niobe and her Children.

Nirvana (nir-vâ'na), *n.* [Skr. *nir*, out, and *vâna*, blown; lit. blown out.] According to the teaching of Buddhism, the condition of one who has attained to the highest state to which a sentient being can reach, and has accordingly become free from desire for material or immaterial existence, from pride and self-righteousness and ignorance. One who has attained this condition will at death pass entirely out of existence.

What then is *Nirvana*, which means simply going out, extinction; it being quite clear, from what has gone before, that this cannot be the extinction of a soul? It is the extinction of that sinful, grasping condition of mind and heart, which would otherwise, according to the great mystery of Karma, be the cause of renewed individual existence. That extinction is to be brought about by, and runs parallel with, the growth of the opposite condition of mind and heart; and it is complete when that opposite condition of mind and heart is reached. *Nirvana* is therefore the same thing as a sinless, calm state of mind; and if translated at all, may best, perhaps, be rendered

holiness—holiness, that is, in the Buddhist sense, perfect peace, goodness, and wisdom. *Rhys Davids.*

Whence the writ, as well as the commission, received the name of *nisi prius*. The judges of assize, by virtue of their commission of *nisi prius*, try the civil causes thus appointed in their several circuits, being said to sit at *nisi prius*, and the courts in which these actions are tried being called courts of *nisi prius*, or *nisi prius* courts. When silver is oxidized and dissolved by nitric acid diluted with two or three times its weight of water it forms a solution which yields transparent tabular crystals on cooling, which are called nitrate of silver. It is sometimes employed for giving a black colour to the hair, and is the basis of the indelible ink for marking linen. Its solution is always kept in the laboratory as a test for chlorine and hydrochloric acid. A salt, called also saltpetre, and in the nomenclature of chemistry nitrate of potassium or potassic nitrate. It is generated spontaneously in the soil, and crystallizes upon its surface in several parts of the world, and especially in the East Indies, whence the greater part of the nitre used in Great Britain is derived. In some parts of the Continent it is prepared artificially from a mixture of common mould or porous calcareous earth with animal and vegetable remains containing nitrogen. It is a colourless salt, with a saline taste, and crystallizes in six-sided prisms. It is chiefly employed in chemistry as an oxidizing agent and in the formation of nitric acid. Its chief use in the arts is in the making of gunpowder. It also enters into the composition of fluxes, and is extensively employed in metallurgy; it is used in the art of dyeing, and is much employed in the preservation of meat and animal matters in general. In medicine it is prescribed as cooling, febrifuge, and diuretic.—*Cubic nitre*. Same as *Nitrate of Soda* (which see under *NITRATE*).

See *NITROUS*.—*Nitric acid* (HNO_3), a most important acid, prepared by distilling a mixture of sulphuric acid and nitre. It is a most powerful oxidizing agent, and is decomposed by almost all the metals. When pure it is a colourless liquid, but is usually yellowish, owing to a small admixture of oxides of nitrogen. Its smell is very strong and disagreeable; and it is so acid that it cannot be safely tasted without being much diluted. It acts with great energy on most combustible substances, simple or compound, and upon most of the metals. It exists in combination with the bases potash, soda, lime, magnesia, in both the vegetable and mineral kingdoms. It is employed in etching on steel or copper; as a solvent of tin to form with that metal a mordant for some of the finest dyes; in metallurgy and assaying; also in medicine, in a diluted state, as a tonic and as a substitute for mercurial preparations in syphilis and affections of the liver; and also in form of vapour to destroy contagion. It is an important elementary principle; it constitutes about four-fifths of common air, the rest being principally oxygen. In its pure state it is remarkable for its negative qualities; that is to say, for the difficulty with which it enters into combination with other matters. It is neither combustible nor a supporter of combustion; it is neither acid nor alkaline; possesses neither taste nor smell. It is most readily obtained from atmospheric air, but it may also be obtained from animal matters. There are five known compounds of nitrogen and oxygen, viz. nitrous oxide, N_2O ; nitric oxide, N_2O_2 ; nitrogen trioxide, N_2O_3 ; nitrogen tetroxide, N_2O_4 ; nitrogen pentoxide, N_2O_5 .

In man the nose serves to modulate the voice in speaking, and to discharge the tears which flow through the lachrymal ducts.

nected with that art or science, as in arithmetic and algebra, for expressing numbers and quantities. In the common or denary scale of notation employed in arithmetic every number is expressed by means of the ten digits, 1, 2, 3, 4, 5, 6, 7, 8, 9, 0, by giving each digit a local as well as its proper or natural value. The value of every digit increases in a tenfold proportion from the right towards the left; the distance of any figure from the right indicating the power of 10, and the digit itself the number of those powers intended to be expressed; thus $3464 = 3000 + 400 + 60 + 4 = 3 \times 10^3 + 4 \times 10^2 + 6 \times 10 + 4$. This scale of notation was introduced into Europe by the Arabs about the latter end of the tenth century. The Roman notation, which is still used in marking dates or numbering chapters, consists of seven characters, viz. I. one; V. five; X. ten; L. 50; C. 100; D. or IJ. 500; M. 1000, sometimes expressed by DĠ or CIJ. In regard to expressing numbers by this notation, it may be observed that, as often as any character is repeated, so many times is its value repeated; a less character before a greater diminishes its value by the less quantity; and a less character after a greater increases its value by the less quantity. The ancient Greeks represented numbers by means of the letters of their alphabet, to which they added three obsolete characters.—*Architectural notation*, a method adopted of placing signs to figures when marking dimensions on drawings; as 'for feet,' 'for inches, and ' for parts, &c.—*Chemical notation*, a system of abbreviating and condensing statements of the chemical composition of bodies, and of their changes and transformations, by means of symbols. Nummulites occupy an important place in the history of fossil shells, on account of the prodigious extent to which they are accumulated in the later members of the secondary, and in many of the tertiary strata. They are often piled on each other nearly in as close contact as the grains in a heap of corn. 2. In *astron.* a small subordinate gyratory movement of the earth's axis, in virtue of which, if it subsisted alone, the pole would describe among the stars, in a period of about nineteen years, a minute ellipsis, having its longer axis directed towards the pole of the ecliptic, and the shorter, of course, at right angles to it. The consequence of this real motion of the pole is an apparent approach and recess of all the stars in the heavens to the pole in the same period; and the same cause will give rise to a small alternate advance and recess of the equinoctial points, by which, in the same period, both the longitudes and right ascensions of the stars will be also alternately increased or diminished. This nutation, however, is combined with another motion, viz. the precession of the equinoxes, and in virtue of the two motions the path which the pole describes is neither an ellipsis nor a circle, but a gently undulated ring; and these undulations constitute each of them a nutation of the earth's axis. Both these motions and their combined effect arise from the same physical cause, viz. the action of the sun and moon upon the earth. See *PRECESSION*.—3. O.

O is the fifteenth letter and the fourth vowel in the English alphabet. The shape of this letter seems to have been taken from the circular configuration of the lips in uttering the sound. The sound that was originally represented by this letter was no doubt a pure vowel sound, such as that in *mortal*, which is also the sound it generally has in the continental tongues. This was not one of the original Aryan vowel sounds (these being *a*, *i*, and *u* sounded as in Latin or Italian), but arose from the modification of an original *a* or *u*. (See *A*.) This sound is produced by protruding the lips with a rounded opening, and *o* is therefore called the labial vowel, *i* (ê) being the palatal, and *a* (â) the guttural. In English *O* has seven distinct sounds and shades of sound: (1) as in *note*, which, as commonly pronounced in the South of England, is really a diphthongal sound, being composed of a long *o* sound terminating in a slight *oo* (as in *proof*) sound. This is the sound heard in *go*, *blow*, *vote*, &c.; also in the digraphs *oa* (*boat*, *groan*, &c.); *oe* (*voce*, *goes*); *ou* (*though*). (2) The similar short sound without the final *oo* sound, commonly heard in unaccented syllables where *o* forms the whole syllable, or terminates it, as in *tobacco*. (3) The sound of *o* in *not*, as in *cost*, *gone*, *top*; also in the digraph *ou* (*though*). (4) The same sound lengthened through the influence of a following *r*; as in *mortal*; also in the digraph *ou* (*brought*, *sought*). (5) The sound of *o* in *move*; as in *do*, *tomb*, *prove*; also in the digraphs *oo* (*room*), *ou* (*through*, *wound*). (6) The same sound but shorter (the sound of *u* in *bull*); as in *wolf*, *woman*; also in the digraphs *oo* (*book*, *wood*), *ou* (*could*). (7) The sound of *u* in *tub*; as in *comfort*, *woman*, *come*, *dane*, *lone*; also in the digraphs *oe* (*does*), *oo* (*blood*), *ou* (*country*, *enough*). The *o* sound in genuine English words commonly represents *A. Sax.* *ô*; thus *A. Sax.* *gâ*, *gâ*, *stân*, *nâ* = *E. go*, *oak*, *stone*, *no*; *oo* again commonly represents *A. Sax.* *ô*; thus *A. Sax.* *fô*, *blô*, *tô* = *foot*, *blood*, *too*, &c. — *O* is the usual character for a cypher or nought; it was also sometimes used by the ancients for 11, and with a dash over it, *O*, for 11,000. — In *old music*, *O* was a mark of triple time (*tempus perfectum*), from the notion that the ternary, or number 3, is the most perfect of numbers, and properly expressed by a circle, the most perfect figure.

O, interj. 1. An exclamation used in earnest or solemn address, appeal, or invocation, and prefixed to the noun of address. In practice authors do not always preserve a distinction between this particle and *oh*, a particle of emotion prefixed to a sentence or clause expressing sentiment or passion. As regards punctuation, when *O* is, or should be, the word, the mark of exclamation, if employed at all, is placed after the noun of address; as, 'Hear, *O* Israel!' but when *oh* is the proper word, the mark is placed immediately after it; thus, *oh*! — *Oh, dear*! and *Oh, dear me*! exclamations expressive of surprise, uneasiness, or exhaustion, fear, pain, and the like. They are regarded as corruptions of *Fr. O Dieu!* or *It. O Dio!* *O God!* and *It. O Dio mio!* *O my God!* — 2. Used as a noun.

Why should you fall into so deep an *O*? *Shak.*

Root meaning unknown.] The English name of the trees and shrubs belonging to the genus *Quercus*, nat. order *Cupuliferæ*; also its wood. The oak from the remotest antiquity has obtained a pre-

eminence among trees, and has not unjustly been styled the 'monarch of the woods.' In the traditions of Europe and a great part of Asia the oak appears as a most important element in religious and civil ceremonies. It was held sacred by the Greeks and Romans, and no less so by the ancient Gauls and Britons. The species of oak are very numerous, generally natives of the more temperate parts of the northern hemisphere. They have alternate simple leaves, which are entire in some, but in the greater number variously lobed and sinuated or cut; evergreen in some, but more generally deciduous. The common oak attains a height of from 50 to 100 or even 150 feet, with a diameter of trunk of from 4 to 8 feet. Noble specimens of oak-trees, and some of them historically celebrated, exist in almost all parts of Britain; but are much more frequent in England than in Scotland. The oak subserves a greater number of useful purposes than almost any other kind of forest tree,

the wood being hard, tough, tolerably flexible, strong without being too heavy, not readily penetrated by water, and bearing alternations of wet and dry better than most other woods. For more than a thousand years British ships were mainly built of common oak (*Q. robur*). The American white oak (*Q. alba*) and the live-oak (*Q. virens*) were also much used for the same

purpose. The bark of the oak-tree is very valuable, and is preferred to all other substances for the purpose of tanning. Gallic acid exists abundantly in the oak. The leaves of *Q. falcata* are employed, on account of their astringency, externally in cases of gangrene; and the same astringent principle which pervades all the species has caused them to be employed as febrifuges, tonics, and stomachics. Cork is the bark of *Q. suber*, or cork oak. (See *CORK*.) Galls are the produce of *Q. infectoria*. (See *GALL*.) The name oak is sometimes popularly applied to timber of very different genera; thus African teak is often called *African oak*; while in Australia

The two largest obelisks were erected by Sesostris in Heliopolis; the height of these was 180 feet. They were removed to Rome by Augustus. Two obelisks in Alexandria, known as Cleopatra's Needles, were offered by Mehemet Ali in 1820 to England and France. The French chose instead the Luxor obelisk, which was erected in Paris in 1833. The English one lay prostrate in the sand until it was removed and erected in London, in 1873, by private enterprise. Formerly, when a man held land *pur autre vie* (for the life of another), and died before that other, as his estate could not descend to his heir nor revert to the donor until the determination of the life upon it, it was considered to belong of right to the first who took possession of it for the remainder of the life, which was termed *general occupancy*. And when the gift was to one and his heirs for the life of another, the heir was said to take as *special occupant*. Ocean (ö'shan), *n.* [L. *oceanus*, from *Gr. океанος*, the ocean.] 1. The vast body of water which covers more than three-fifths of the surface of the globe; the sea. Although no portion of it is completely detached from the rest, the ocean has often been divided into several great basins or areas, viz. the Pacific Ocean, the Atlantic Ocean, and the Indian Ocean, the great bodies of water which divide the land-masses of the Old and New Worlds, and which intervene between the former and the southern continent, Australia; together with the Arctic and the Antarctic Oceans, round the north and south poles respectively. Between these no very definite limits can be drawn; thus it is impossible to say where the Atlantic or the Pacific ends, and the Antarctic or Southern Ocean begins. The Arctic Ocean, at least that portion of it that washes the northern shores of Europe and Asia, is often treated as a portion of the Atlantic basin. The minor ramifications of the ocean into land are known as seas, bays, gulfs, creeks, inlets, &c., according to their forms and dimensions. The bed of the ocean appears to present the same irregularities as the surface of the land, being diversified by rocks, mountains, plains, and deep valleys. The level of the ocean, generally speaking, is everywhere the same, but the disturbing actions of the sun and moon, of the winds, and of currents occasion slight inequalities. The extreme depth of the ocean hitherto sounded is 5555 fathoms, which was found off the Virgin Islands, in the West Indies. The saltiness of the ocean is due to the presence of various saline ingredients (chiefly chloride of sodium or common salt), which are generally found in the proportion of from 30 to 40 per thousand. Recent observations have shown that the colour and transparency of the water of the ocean are in a large measure dependent on the degree of saltiness. In general it is found that the greater the saltiness, the greater the transparency, and also that where the saltiness is very great the water is of a dark blue colour, that where it is less the water is of lighter blue, inclining to green, and that in the neighbourhood of rivers (where the saltiness is reduced to a minimum) the water is as a rule of a greenish yellow.—2. An immense expanse; as, the boundless ocean of eternity; *oceans* of duration and space.

I do not know what I may appear to the world, but to myself I seem to have been only like a boy playing on the sea-shore, and diverting myself in now and then finding a smoother pebble, or a prettier shell than ordinary, while the great ocean of truth lay all undiscovered before me. *Newton*.

The next to this is the octave, where the more acute sound makes precisely two vibrations, while the grave or deeper makes one; consequently, the vibrations of the two meet at every single vibration of the more grave one. burning with a more or less luminous flame. The oils are usually divided into the *fat* or *fixed oils*, and the *volatile* or *essential oils*. The name oil is also popularly given to certain inflammable substances, such as naphtha or petroleum (mineral oils). *Fat* oils are subdivided into the *drying* and the *non-drying oils*. The former class includes all oils which thicken when exposed to the air through the absorption of oxygen, and are converted thereby into varnish, as for example linseed, nut, poppy, and hempseed oil. The *non-drying* oils when exposed to the air also undergo a change resulting in the formation of acid, disagreeably smelling, acid substances. This decomposition, which is only partial, seems to be brought about by the presence of cellular matter derived from the plant or animal which has yielded the oil, this substance acting as a ferment on the fatty matter, and such acids as butyric, caproic, valeric, &c., being thereby produced. The fixed vegetable oils are generally prepared by subjecting the seeds of the plant to pressure; the animal oils are, for the most part, the fluid parts of the fat of the animal. Vegetable fixed oils are lighter than water, unctuous and insipid, or nearly so; they all consist of two proximate principles, *stearine* and *elaine*. They are sources of artificial light, and when acted on by an alkali form soaps. *Volatile oils* are generally obtained by distilling the vegetables which afford them with water; they are acrid, caustic, aromatic, and limpid; they are mostly soluble in alcohol, forming essences. They boil at a temperature considerably above that of boiling water, some of them undergoing partial decomposition. A few of them, such as oil of turpentine, of lemon peel, of capivi balsam, &c., are hydrocarbons; the greater number, however, contain oxygen as one of their ultimate elements. They are chiefly used in medicine and perfumery; and a few of them are extensively employed in the arts as vehicles for colours, and in the manufacture of varnishes, especially oil of turpentine.—*Oil of talc*, a nostrum formerly famous as a cosmetic, probably because that mineral, when calcined, became very white, and was considered a fit substitute for ceruse.

Olive (*Olea europæa*).

tree, in height from 20 to 30 feet, with stiff narrow dark-green or bluish leaves. The flowers are produced in small axillary bunches, and appear in June, July, and August. The fruit is a berryed drupe of an oblong spheroidal form, with a thin, smooth, and usually blackish skin, containing a greenish soft pulp adherent to a rough, oblong, and very hard stone. It is bitter and nauseous, but replete with a bland oil. The olive is a native of Syria and other Asiatic countries, and flourishes only in warm and comparatively dry parts of the world. It grows slowly, and is very long-lived. The olive-tree has in all ages been held in peculiar estimation. It was anciently sacred to Minerva. Olive wreaths were used by the Greeks and Romans to crown the brows of victors, and it is still universally regarded as an emblem of peace. The wood of the olive-tree is beautifully veined, and has an agreeable smell. It is in great esteem with cabinet-makers, on account of the fine polish of which it is susceptible. But the olive-tree is principally cultivated for the sake of its oil, which is contained in the pericarp. (See OLIVE-OIL.) It is cultivated for this purpose in Italy, France, Spain, Malta, Turkey, the Ionian Islands, &c. Another species of olive, the *O. fragrans*, inhabits China, Japan, and Cochinchina. The flowers are used by the Chinese to mix with and perfume their tea, and also, together with the leaves, for adulterating tea. The only American species (*O. americanus*) is in some districts called *devil-wood*, on account of the excessive hardness of the wood and the extreme difficulty of splitting it.—2. The fruit or drupe of the olive, from which olive-oil is obtained, and which is also much used as a condiment. *Preserved or pickled olives* are the green unripe fruit deprived of part of their bitterness by soaking them in water, and then preserved in an aromatized solution of salt.—3. It is the lightest of all the fixed oils. There are four different kinds of olive-oil known in the districts where it is prepared. (a) That which is expressed from the ripe fruit immediately after being collected is most esteemed, and is called *virgin oil*. (b) *Ordinary oil*, prepared by pressing the olives, previously crushed and mixed with boiling water, or made from the olives which have been used for obtaining the virgin oil. (c) *Oil of the infernal regions* (*huile d'enfer*), collected from the surface of the water which has been employed in the preceding operation, after being left in large reservoirs for some time. It is only fit for burning in lamps; hence called also *lamp oil*. (d) *Fermented oil*, obtained by leaving the fresh olives in heaps for some time, and pouring boiling water over them before pressing the oil. Olive-oil is much used as an article of food in the countries in which it is produced, and to a smaller extent in other countries, to which it is exported also for medicinal and manufacturing purposes, &c. The best olive-oil is said to be made in the vicinity of Aix, in France; the kind known by the name of Florence oil is also of a superior quality, and is mostly used for culinary purposes. By far the largest portion of olive-oil brought to England is imported from Italy, principally from Gallipoli. Spain also sends us a large quantity. Called also *Sweet-oil*.

Ontogenesis (on-to-jen'e-sis), *n.* [Gr. *ón*, *ontos*, being, and *genesis* (which see).] In *biol.* the history of the individual development of an organized being, as distinguished from *phylogenesis*, or the history of genealogical development, and from *biogenesis*, or life-development generally.

Ontogenesis and *phylogenesis* stand in the closest possible connection, and the one cannot be understood without the other. This fundamental biogenetic law, upon which the comprehension of the entire doctrine of organic evolution absolutely depends, may be shortly expressed thus.—The history of the germ is an abstract or epitome of that of the race; in other words, *ontogenesis* is a brief recapitulation of *phylogenesis*; or, in somewhat greater detail, thus:—The series of forms presented by the individual organism during its development from the original germ to its perfect condition is a short and compressed repetition of the long series of forms presented by the ancestors of this organism, from the earliest periods of the so-called organic creation up to the present time. Trans. of Haeckel.

Ophidia (ô-fid'i-a), *n. pl.* [From Gr. *ophis*, a serpent.] An order of reptiles, comprising the snakes and serpents, characterized by an elongated and cylindrical body covered with horny scales, but never with bony plates. There is never any breast-bone nor pectoral arch, nor fore-limbs, nor as a rule any traces of hind-limbs. In a few cases (as in Python and Tortrix) rudimentary hind-limbs may be detected. The ribs are always numerous, some serpents having more than 300 pairs. These not only serve to give form to the body and aid in respiration, but are also organs of locomotion, the animal moving by means of them and of its scales, which take hold on the surface over which it passes. The vertebrae are formed so as to give great pliancy, most, if not all serpents being able to elevate a large portion of their body from the ground. They have hooked, conical teeth, not lodged in distinct sockets, nor for mastication, but merely to hold their prey. The tongue, which is forked and can be protruded and retracted at pleasure, is probably rather an organ of touch than of taste. The eye is not protected by eyelids. In the venomous serpents, as vipers, rattlesnakes, &c., there are no teeth in the upper jaw excepting the two poison fangs. These are long, firmly fixed in a movable bone, above which there is a gland for the elaboration of poison. Each tooth is perforated by a tube through which the poison is forced. The heart has three chambers, two auricles and a ventricle. Many serpents, especially the larger species, as the boas, subsist on prey thicker than themselves, which they crush by constriction,

and which they are able to swallow from the throat and body being capable of great dilatation. Gray divides the order into two sub-orders, *Viperina* and *Colubrina*, the former having only two poison fangs in the upper jaw, the latter having solid teeth, besides grooved fangs.

It flows from incisions made in the heads of the plant, and the best flows from the first incision. It is one of the most energetic of narcotics, and at the same time one of the most precious of all medicines, and is employed in a great variety of cases, but most commonly for the purpose of procuring sleep and relief from pain; but its habitual use is attended with similar if not worse effects than the intemperate use of ardent spirits. A full dose is intoxicating and exhilarating, but its effects are dangerous and fatal if taken in large quantities. It is heavy, of a dense texture, of a brownish yellow colour, not perfectly dry, but easily receiving an impression from the finger; it has a faint smell, and its taste is bitter and acrid. The chief active principle of opium is morphia, or morphine in combination with meconic acid. Opium also contains narcotine, narceine, codeine, gum-resin, extractive matter, and small portions of other proximate principles. The principal part of our supply of opium is brought from Turkey. It is said to be obtained from an umbelliferous plant, the *Opopanax Chironum*, a native of Mediterranean

Europe. From the base of the stem or summit of the root of this plant when wounded flows a yellow milky juice which hardens on exposure to the sun and air. This constitutes *opopanax*. They are fed and nocturnal animals, arboreal in their habits, living constantly on trees, and there pursuing birds, insects, &c., although they do not despise fruit. The females of certain species have an abdominal pouch in which are the mammae and in which they can inclose their young. The true opossums are now limited to the American continent, but their former existence in Europe is proved by the fossil remains that have been found in the Paris basin. The best known species of opossum is the *Didelphys virginiana*, very common in the United States. It is almost the size of a large cat, the general colour whitish gray, and the whole hair of a wool-like softness. The flesh is said to be nutritious and pleasant to the taste, and the fur is employed in the manufacture of various articles. On the ground the motions of the opossum are awkward and clumsy, but on the branches of a tree it moves with great celerity and ease, using the prehensile tail to assist its motions. When caught or threatened with danger the opossum counterfeits death, and 'playing possum' has on this account passed into a proverb as used to indicate any deceitful proceeding. The female has from ten to fifteen young, which are for a long time nourished in the pouch, to which they resort when alarmed.

The orbits of the planets are elliptical, having the sun in one of the foci; and they all move in these ellipses by this law, that a straight line drawn from the centre of the sun to the centre of any one of them, termed the *radius vector*, always describes equal areas in equal times. Also, the squares of the times of the planetary revolutions are as the cubes of their mean distances from the sun. The satellites also move in elliptical orbits, having their respective primaries in one of the foci. The *elements of an orbit* are those quantities by which its position and magnitude, for the time, are determined; such as the major axis and eccentricity, the longitude of the node, and inclination of the plane to the ecliptic, and the longitude of the perihelion.—2. † A small orb, globe, or ball. The flowers are very irregular, the perianth being formed of three sepals and three petals, the lowest of the latter being often very different in shape and markings from the rest, and called the labellum or lip: both sepals and petals are often richly and similarly coloured. There is usually only one stamen (sometimes two), usually confluent with the style and stigma. An ancient form of trial to determine guilt or innocence, practised by the rude nations of Europe, and still practised in the East and by various savage tribes.

In England there were two principal kinds of ordeal, *fire-ordeal* and *water-ordeal*; the former being confined to persons of higher rank, the latter to the common people. Both might be performed by deputy, but the principal was to answer for the success of the trial. Fire-ordeal was performed either by taking in the hand a piece of red-hot iron, or by walking barefoot and blindfold over nine red-hot ploughshares laid lengthwise at unequal distances; and if the person escaped unhurt, he was adjudged innocent, otherwise he was condemned as guilty.

Water-ordeal was performed either by plunging the bare arm to the elbow in boiling water, escape from injury being considered proof of innocence; or by casting the person suspected into a river or pond, and if he floated without an effort to swim it was an evidence of guilt, but if he sunk he was acquitted. It was at last condemned as unlawful by the canon law, and in England it was abolished by an order in council of Henry III. It is probable our proverbial phrase, to go through fire and water, denoting severe trial or danger, is derived from the ordeal; as also the trial of witches by water. Besides the fire-ordeal and water-ordeal, various other kinds of ordeal were practised in ancient times.—2. viz. Doric, Ionic, Tuscan, Corinthian, and Composite. (See these terms.) Each order consists of two essential parts, a column and an entablature; the column being divided into three parts, the base, the shaft, and the capital; and the entablature into three parts also, the architrave, the frieze, and the cornice. The character of an order is displayed, not only in its column, but in its general forms and detail, of which the column is, as it were, the regulator. (See COLUMN.) The Tuscan and Composite are Roman orders, the other three are Grecian.

One method of superseding a question already proposed to the house is by moving for 'the order of the day to be read.' But it can be, in its turn, superseded by a motion to adjourn. (b) *Milit.* specific directions or information issued by a superior officer to the troops under his command.

In the *Church of England*, a candidate for holy orders must be in possession of a *title*; that is, a sort of assurance from a rector to the bishop that, provided that the latter finds the party fit to be ordained, the former will take him for his curate with a stated salary. The candidate is then examined by the bishop or his chaplain as to his faith and his erudition, and he must bring letters testimonial of his life and doctrine for three years previous, from three beneficed clergymen, and subscribe to the Thirty-nine Articles and the Liturgy. He must be twenty-three years of age before he can be ordained deacon, and twenty-four before he can be ordained priest, or admitted into *full orders*. Ordinance (ord'nans), *n.* [Formerly *ordinance, ordenance, ordonnance, artillery*, the same word as *ordnance*, *Fr. ordonnance, arrangement, disposition, equipment*. *Ordnance* has probably come to have its present meaning by the suppression of a portion of a designation of which it formed part; and from having such a meaning as 'equipment' it has come to be applied to a particular kind of military equipment or appliance. Wedgwood quotes a passage from an old chronicle in which the transition of meaning seems to appear: 'The *ordenance* of the kinges gunes avayled not, for that day was so grete rayne that the gones lay depe in the water, and so were queynt and might not be schott.'] Cannon or great guns, mortars, and howitzers; artillery.—*Board of ordnance*, the name given to a board, consisting of a master-general, surveyor-general, clerk, and store-keeper, which formerly provided the army and navy with guns, ammunition, and arms of every description, and superintended the providing of forage for the troops at home, the erection of fortifications, &c. The Crimean disasters in 1854 showed the defects of this board, which was shortly afterwards dissolved, the duties being divided among different branches of the war office.—*Ordnance survey*, the survey of Britain, undertaken by the government, and executed by select corps of the Royal Engineers and civilians. The charts exhibit, in addition to the ordinary features of a map, the extent and limits of properties, and rivers, roads, houses, &c., are laid down on them in their just proportions, and not, as in ordinary maps, exaggerated. The scale adopted by the British government is, for towns having 4000 or more inhabitants, $\frac{1}{6250}$ of

the linear measurement, which is equivalent to 126.72 inches to a mile, or an inch to 41.3 feet; for parishes (in cultivated districts), $\frac{1}{25000}$ of the linear measurement, equal to 25.344 inches to a mile, or 1 square inch to an acre; for counties, 6 inches to a mile; for the kingdom, a general map, 1 inch to a mile. The purposes to which these large plans may be applied are, as estate plans, for managing, draining, and otherwise improving land, for facilitating its transfer by registering sales and incumbrances, and as public maps, according to which local or general taxes may be raised, and roads, railways, canals, and other public works laid out and executed.

Organ (or'gan), *n.* [*L. organum, from Gr. organon, an instrument, implement, engine, from ergō, for uerō or vergo, to work, from the same root as that of E. work*.] 1. In the widest sense, an instrument or means; that which performs some office, duty, or function; that by which some important action is performed or object accomplished: in a narrow and more common sense, a part of an animal or vegetable body by which some action, operation, or function is carried on. Thus the heart, arteries, and veins of animals are *organs* of circulation; the lungs are *organs* of respiration; the nose is the *organ* of smell, the eye of sight; both plants and animals have reproductive *organs*.

For you must know, we have . . . Lent him our terror, dress'd him with our love, And given his deputation all the *organs* Of our own power. *Shak.*

He laughed all over himself, from his shoes to his *organ* of benevolence. *Dickens*.

2. A medium, instrument, or means of communication between one person or body and another; a medium of conveying certain opinions; as, a secretary of state is the *organ* of communication between the government and a foreign power; an official gazette is the *organ* of a government; hence, specifically, a newspaper; as, the *Tory organ* in such a town.—3. The vocal *organs* collectively; the voice. 'Thy small pipe is as the maiden's *organ* shrill.' *Shak.* The term is still technically used, as when we say that such a singer has a magnificent *organ*.—4.† A wind musical instrument in general: Shakspeare applies the term to a pipe, and perhaps that is the meaning in quotation under 3.—5. The largest and most harmonious of wind instruments of music, consisting of a great number of pipes of different sizes, formed of wood and of different

kinds of metal, some of which are flute-pipes, or mouth-pipes, and others reed-pipes, all of them being made to sound by means of compressed air applied to them through certain channels by bellows worked either by human force or by steam or otherwise. An organ may have several wind-chests filled by the same bellows, and several key-boards, each key-board and wind-chest representing a distinct organ. In the largest instruments the number of these organs generally amounts to five—viz. the *great organ*, the *choir organ*, the *swell organ*, the *solo organ*, and the *pedal organ*. The key-boards for the hand are termed *manuals*, that for the feet the *pedal*. The most usual compass of the manuals is from C₄ (8 feet) to F in alt, four octaves and a half; that of the pedal from C₂ to E or F, two and a quarter to two and a half octaves; but this range is increased by stops which give a note an octave, or in the pedal organ even two octaves lower, and sometimes one of the harmonics higher in pitch.—*Barrel-organ*. See *BARREL-ORGAN*.—*Cabinet-organ*. Same as *Chamber-organ* (which see).

Organ (or'gan), *v.t.* To furnish with organs; to form organically; to organize.

Organic (or'gan'ik), *a.* [L. *organicus*, from *organum*, an implement. See *ORGAN*.] 1. Pertaining to an organ or to organs of animals and plants; as, an *organic* function; an *organic* disease.—2. Pertaining to objects that have organs, hence to the animal and vegetable worlds; pertaining to or exhibiting characteristics peculiar to animal or vegetable life and structure; as, *organic* bodies; *organic* life; *organic* remains.

The term '*organic*,' as applied to any substance, in no way relates to the presence or absence of life. The materials which compose the living body are of course '*organic*' in the main, but they are equally so after death has occurred—at any rate for a certain time—and some of them continue to be so for an indefinite period after life has departed. Sugar, for example, is an *organic* product; but in itself it is of course dead, and it retains its last life after the organism which produced it has lost all vitality. *H. A. Nicholson*.

See *INORGANIC*.—3. Forming a whole with a systematic arrangement of parts; organized; systematized.

tions without being readily decomposed by the chemical changes.—*Organic remains*, the name given to those organized bodies, whether animals or vegetables, found in a fossil state. Certain families of animals are found pervading strata of every age, and possessing the same generic forms which are to be found among existing animals. There are, however, other families, both animal and vegetable, which are confined to particular formations, their disappearance and replacement by distinct forms being apparently sudden, while the changes of genera and species are still more frequent. It is in the paleozoic series that the remains of organized beings begin to be found; and already we find there the remains of all divisions of the animal kingdom, Vertebrata, Mollusca, Articulata, Zoophytes, even Protozoa. In the secondary strata we find a series of saurian reptiles, and animals strangely uniting the characters of bird and reptile. The reptiles are principally of a gigantic size, many of them marine, others amphibious, and others terrestrial. In the tertiary series we find that the fossil remains of both animals and vegetables are much more numerous, and belong to higher types, and that they bring us down, by a natural transition, to those of our own times. A similar succession of vegetable remains have been obtained from rocks of various ages. See *GEOLOGY*.

He is represented under many different forms, and compared sometimes to the sun and sometimes to the Nile. In particular his soul was supposed to animate a sacred bull called Apis, and thus to be continually present among men. (See **APIS**.) The

Osmium (os'mi-um), *n.* [Gr. *osmē*, odour.] Sym. Os. At. wt. 199.0; sp. gr. 21.4. A metal discovered by Mr. Smithson Tennant in 1803, in the grains of native platinum, in combination with iridium. This compound received the name of *osmide of iridium*. It occurs in flat grains and hexagonal crystals. The separation of osmium from iridium is effected by a tedious process. Osmium is a bluish white metal, very hard and more infusible than any other metal. When finely divided this metal readily burns in the air, forming a tetroxide usually called *osmic acid*. This substance is white, very volatile, extremely fusible, soluble in water, and crystallizable. It possesses an extremely disagreeable odour, somewhat resembling that of chlorine. This property suggested the name of the metal. Osmium combines with chlorine in different proportions, and also with sulphur. It forms alloys with some other metals.

It includes *endosmose*, or the tendency of a fluid to pass into another, and *exosmose*, or the tendency of a fluid outward. When two saline solutions, differing in strength and composition, are separated by a porous diaphragm or septum of bladder, parchment paper, or porous earthenware, they mutually pass through and mix with each other; but they pass with unequal rapidities, so that, after a time, the height of the liquid on each side is different.

Its length is about 2 feet, and the extent of its wings not less than 5½ feet. It is an inhabitant of nearly the whole of Europe and of Northern Asia. It is also found in North America. It has received the name from fragments of bones having been found in its stomach. Its habitat is on the sea-shore, and on the banks of rivers and lakes. It feeds on fish, which it takes by suddenly darting upon them when near the surface of the water. The osprey was anciently supposed to have the power of fascinating its prey before seizing it.

The *osprey*, oft here seen, though seldom here it breeds.
